?

⋮

Matching two given
views for depth

Search for a matching
view for recognition

Inverted file index

- New query image is mapped to indices of database images that share a word.

Instance recognition: remaining issues

- How to summarize the content of an entire image? And gauge overall similarity?
- How large should the vocabulary be? How to perform quantization efficiently?
- Is having the same set of visual words enough to identify the object/scene? How to verify spatial agreement?
- How to score the retrieval results?

Can we be more accurate?

So far, we treat each image as containing a “bag of words”, with no spatial information

Can we be more accurate?

So far, we treat each image as containing a “bag of words”, with no spatial information

Real objects have consistent geometry

Spatial Verification

Query

DB image with high BoW
similarity

Query

DB image with high BoW
similarity

Both image pairs have many visual words in common.

Spatial Verification

Query

DB image with high BoW
similarity

Query

DB image with high BoW
similarity

Only some of the matches are mutually consistent

Spatial Verification: two basic strategies

- RANSAC
 - Typically sort by BoW similarity as initial filter
 - Verify by checking support (inliers) for possible transformations
 - e.g., “success” if find a transformation with $> N$ inlier correspondences
- Generalized Hough Transform
 - Let each matched feature cast a vote on location, scale, orientation of the model object
 - Verify parameters with enough votes

RANSAC verification

Recall: Fitting an affine transformation

Approximates viewpoint changes for roughly planar objects and roughly orthographic cameras.

$$\begin{bmatrix} x'_i \\ y'_i \end{bmatrix} = \begin{bmatrix} m_1 & m_2 \\ m_3 & m_4 \end{bmatrix} \begin{bmatrix} x_i \\ y_i \end{bmatrix} + \begin{bmatrix} t_1 \\ t_2 \end{bmatrix}$$

$$\begin{bmatrix} x_i & y_i & \dots & 0 & 0 & 1 & 0 \\ 0 & 0 & x_i & y_i & 0 & 1 & \dots \end{bmatrix} \begin{bmatrix} m_1 \\ m_2 \\ m_3 \\ m_4 \\ t_1 \\ t_2 \end{bmatrix} = \begin{bmatrix} \dots \\ x'_i \\ y'_i \\ \dots \end{bmatrix}$$

RANSAC verification

Instance recognition: remaining issues

- How to summarize the content of an entire image? And gauge overall similarity?
- How large should the vocabulary be? How to perform quantization efficiently?
- Is having the same set of visual words enough to identify the object/scene? How to verify spatial agreement?
- How to score the retrieval results?

Scoring retrieval quality

Query

Database size: 10 images

Relevant (total): 5 images

$\text{precision} = \# \text{relevant} / \# \text{returned}$

$\text{recall} = \# \text{relevant} / \# \text{total relevant}$

Results (ordered):

What else can we borrow from text retrieval?

China is forecasting a trade surplus of \$90bn (£51bn) to \$100bn this year, a threefold increase on 2004's \$32bn. The Commerce Ministry said the surplus would be created by a predicted 30% increase in exports to \$750bn,

compared with \$660bn. The surplus will annoy the US because China's deliberate policy is to agree to a yuan is also needed to govern the country. China's demand so far has been to have the yuan against the dollar. The US has permitted it to trade within a narrow band but the US wants the yuan to be allowed to move freely. However, Beijing has made it clear that it will take its time and tread carefully before allowing the yuan to rise further in value.

China, trade, surplus, commerce, exports, imports, US, yuan, bank, domestic, foreign, increase, trade, value

tf-idf weighting

- Term frequency – inverse document frequency
- Describe frame by frequency of each word within it, downweight words that appear often in the database
- (Standard weighting for text retrieval)

Number of
occurrences of word
i in document d

$$t_i = \frac{n_{id}}{n_d} \log \frac{N}{n_i}$$

Total number of
documents in
database

Number of words in
document d

Number of documents
word i occurs in, in
whole database

Query expansion

Query: ***golf green***

Results:

- How can the grass on the ***greens*** at a ***golf*** course be so perfect?
- For example, a skilled ***golfer*** expects to reach the ***green*** on a par-four hole in ...
- Manufactures and sells synthetic ***golf*** putting ***greens*** and mats.

Irrelevant result can cause a `topic drift`:

- Volkswagen ***Golf***, 1999, ***Green***, 2000cc, petrol, manual, , hatchback, 94000miles, 2.0 GTi, 2 Registered Keepers, HPI Checked, Air-Conditioning, Front and Rear Parking Sensors, ABS, Alarm, Alloy

Recognition via alignment

Pros:

- Effective when we are able to find reliable features within clutter
- Great results for matching specific instances

Cons:

- Scaling with number of models
- Spatial verification as post-processing – not seamless, expensive for large-scale problems
- Not suited for category recognition.

Summary

- **Matching local invariant features**
 - Useful not only to provide matches for multi-view geometry, but also to find objects and scenes.
- **Bag of words** representation: quantize feature space to make discrete set of visual words
 - Summarize image by distribution of words
 - Index individual words
- **Inverted index**: pre-compute index to enable faster search at query time
- **Recognition of instances via alignment**: matching local features followed by spatial verification
 - Robust fitting : RANSAC, GHT

Lessons from a Decade Later

- For *Category* recognition (project 4)
 - Bag of Feature models remained the state of the art until Deep Learning.
 - Spatial layout either isn't that important or its too difficult to encode.
 - Quantization error is, in fact, the bigger problem. Advanced feature encoding methods address this.
 - Bag of feature models are nearly obsolete. At best they seem to be inspiring tweaks to deep models e.g. NetVLAD.

Lessons from a Decade Later

- For *instance* retrieval (this lecture)
 - deep learning is taking over.
 - learn better local features (replace SIFT) e.g. MatchNet
 - or learn better image embeddings (replace the histograms of visual features) e.g. Vo and Hays 2016.
 - or learn to do spatial verification e.g. DeTone, Malisiewicz, and Rabinovich 2016.
 - or learn a monolithic deep network to recognition all locations e.g. Google's PlaNet 2016.
